

HVAC SAVE CONTRACTOR TRAINING

INSTALL AND IMPROVE WITH GREATER CONFIDENCE

HOW HVAC SAVE WORKS:

HVAC SAVE (System Adjustment and Verified Efficiency) is a one-day training and certification that prepares you to implement HVAC Quality Installation and Quality Maintenance practices for new and existing systems and equips you with the tools to measure the installed operating efficiency of almost any heating and/or cooling system. The success of **HVAC SAVE** is due in great part to the web based software that enables you to assess HVAC equipment performance in real time.

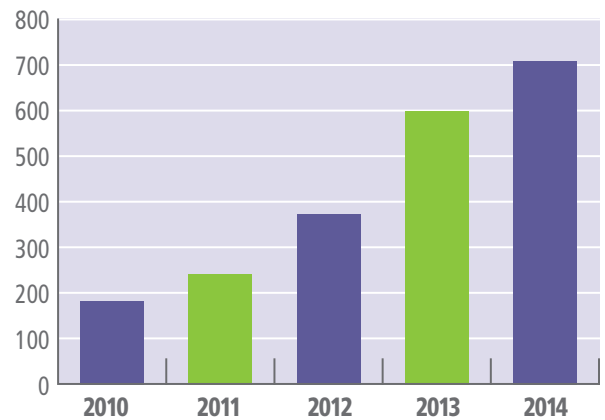

- A nine hour in-person class that combines classroom instruction and our **HVAC SAVE** software, as well as white-board diagrams, explanations, and examples to prepare you to implement concepts into your regular business activities
- Focuses on essential mechanical adjustments and additions that optimize the performance of installed equipment, such as fan speed adjustment, airflow adjustments, and filtration system modifications
- Allows you to take your service to new heights in performance and efficiency to improve comfort, save money, and save energy for your customers

- Alliant Energy, Black Hills Energy, Cedar Falls Utilities, and MidAmerican Energy require that HVAC equipment eligible for rebates be installed by an **HVAC SAVE** certified contractor.
